

LOCKN-WALK®

ENGINE SHOP ERGONOMIC SAFETY PLATFORM

Made of industrial quality 5052-H32 grade industrial strength aluminum, the LockNWalk is designed to securely fit over the horizontal support rail of the engine stand, locked by a safety pin through the double gusset. This enables engine technicians to stand longer with more comfort close to their work, increasing both job satisfaction and performance while reducing the possibility of foot thrombosis. The LOCKN-WALK platform slides along the rail or can be lifted and repositioned quickly. The LOCKN-WALK comes in 12" and 24" widths, and fits 85-90% of all engine shop stands used to service engines for most Boeing and Airbus commercial aircraft.

Notice how the technician on the left must lean forward, balanced on the narrow rail on the balls of his feet, while the technician on the LOCKN-WALK stands upright in comfort with a wide working range of movement across the platform.
